Pencil Line Resistance

Multimeter

10 cm 9 cm 3 cm 3 cm 5 cm 4 cm 5 cm 4 cm 3 cm 1 cm 2 cm 1 cm 1 cm 1 cm 1 cm For this activity you will need a multimeter, ruler, pencil, and paper.

Using your pencil to make a dark/bold line that is approximately 10cm long and marked off in 1cm increments.

Keeping the **black probe lead** at the the Ocm mark, slide the **red probe lead** up the line and measure the amount of resistance at each centimeter marker until you have measured the resistance for the entire line.

Measuring Resistance on a Pencil Line	
Length of Line (cm)	Resistance (KΩ)
1	12
2	19
3	27
4	38
5	45
6	53
7	64
8	73
9	84
10	97

TEAGHER RESOURCES

When you graph the data, the information is a bit easier to see. What are some other ways you can communicate the data collected to others?

Pencil Line Resistance

Multimeter

Here are some other things to think about and investigate! Use your journals to write down your thoughts! Did you notice anything else about the pencil line that affected the amount of measured resistance?

Explore if different pencils have different measured resistance!

Everyone's data looks a bit different. Why do you think that is?

Based on your data, can you guess the resistance of any point on the line? How do you know?

What does the data tell you about the relationship between the measured resistance and the length of the pencil line? Try measuring the resistance of lines with different thicknesses and lengths!

Create a line with the least/most amount of resistance in the class!

What else can you investigate?
